# AI Receptionist Blueprint™

Where to deploy AI in an established home-service business—and where not to.

**For operators who already have demand.**

This is about converting more of the demand you already paid for into booked jobs, completed work and cash.

## 1. Where AI actually earns its keep

For an established home-service company, AI is useful when the business has enough lead flow and conversation volume to make manual handling expensive. Start with intake, classification, summaries, drafting, routing and recovery.

- Prioritize high-volume repetitive work.
- Keep pricing exceptions and sensitive customer situations human-led.
- Give the AI strict boundaries and approved knowledge.

## 2. Build the AI receptionist around outcomes

The goal is not 'sound human.' The goal is to identify the job, capture the details that matter, route correctly and move the prospect toward a booked appointment or human conversation.

- Identify service, location, urgency and basic fit.
- Answer only approved FAQs.
- Never invent availability, pricing or promises.
- Escalate when confidence is low.

### 3. Connect the system

The useful architecture is event → AI decision → action → record → human exception. The AI should write useful structured data back to the operating system.

- Capture structured fields, not only transcripts.
- Trigger booking, follow-up or escalation from status changes.
- Keep a clean audit trail for important actions.

## 4. Add automation after measurement

Automate the bottleneck that is already visible. Examples: missed-call recovery, estimate follow-up, lead routing, appointment reminders, post-job review requests and owner reporting.

- Start with one workflow.
- Measure baseline performance first.
- Roll back anything that harms customer experience.

## 5. The owner dashboard

The final system should make the owner smarter: today's unworked leads, high-value opportunities, appointments at risk, revenue leaks and system exceptions.

- Show dollars and jobs, not vanity activity.
- Review exceptions daily and system performance weekly.
- Use the data to improve scripts, staffing and process—not just prompts.
